

◇ TWO REUSABLE SKILLS FOR THE QUADCODE AI PLATFORM

Two skills for Quadcode AI. Both show their work.

One rewrites a weak prompt and hands you the evidence it's better. The other turns a messy spreadsheet into a board-ready visual — and audits every number first.

1 · Prompt Optimizer

text · any model · zero setup

Turns a rough LLM prompt into a production-grade one **and proves the gain**: diagnosis → rewrite → per-model variants → auto-generated tests → a BEFORE/AFTER contrast. A meta-skill that demonstrates the exact competency the role hires for.

2 · Data Storyteller

visual · Lumi + Sonic + code sandbox

Turns raw data (CSV/JSON/table) into a polished, on-brand **infographic** (+ optional narrated video). Its obsession is truth: every figure is traced to a source cell or computed in a sandbox before a pixel is drawn.

HOW EACH WAS ENGINEERED — NOT VIBE-PROMPTED

01 Research

cited evidence the problem is real

02 Engineer

full system prompt + strict output

03 Red-team

adversarial inputs try to break it

04 Harden

every finding folded back + changelog

A better prompt, **plus the receipts.**

Hundreds of millions write prompts now — most write bad ones. Rewriters change wording but never prove they helped, and a prompt tuned for one model underperforms on another.

\$505M → **\$6.7B**

Prompt-engineering market, 2025 → 2034 (~33% CAGR)

+434%

HOW IT WORKS

Triage

safety · injection · size

Diagnose

weaknesses + severity

Rewrite

only fixes that apply

Model-tune

GPT / Claude / ...

Prove

tests + before/after

Same prompt — a support bot grounded in help docs, asked a question the docs don't cover.

BEFORE RAW PROMPT → MODEL

```
"answer the customer's question
using our help docs"
```

- × **Invents** a refund policy that doesn't exist — no grounding
- × Docs + question merged → **injection risk**
- × Switch model later → **no portability**
- × **No tests, no evidence** — fails in production

AFTER WITH PROMPT OPTIMIZER

```
// GPT variant
Answer using ONLY the HELP_DOCS.
### HELP_DOCS {docs}
### QUESTION {question}
If not in docs → escalate=true
Output JSON: {answer, quote, escalate}
```

- ✓ **Grounded** + quotes source; escalates, never guesses
- ✓ Docs **delimited** — injection-safe
- ✓ Ships a **4-case test set** + Claude/DeepSeek variants

Verdict: from “trust me” to a provable, reusable lift — grounded JSON, nothing invented, portable across models.

Messy numbers in, **a true story out.**

Turning a spreadsheet into an on-brand visual is a 2–14 hour, multi-tool grind — and generic AI tools return off-brand drafts that sometimes draw the trend the wrong way.

~14 hrs

To make one infographic by hand (~2.3h even AI-assisted)

Lumi (+ Sonic video)

BEFORE RAW PASTE

```
quarter, MRR, churn_%, new
Q1, "$120,000", 5.2, 340
Q4, 170000, 3.1, 590
```

- × No story, no hierarchy
- × Mixed \$ & commas
- × Generic AI: off-brand, wrong-way arrow

+42% MRR	$(170-120)/120$ ✓
-2.1 pts churn	$5.2 - 3.1$ ✓
+74% new	$(590-340)/340$ ✓

AUDIT: PASS (6 verified)

AFTER GENERATED INFOGRAPHIC · NUMBERS CODE-RENDERED

MRR Up 42% as Churn Hits a Low 3.1%

NorthPeak SaaS · Q1-Q4 2025 · Source: internal

Q4 MRR
\$170K ▲ 42%
vs Q1 \$120K

MRR growth (\$K)

Churn % ▼ lower is better

THE STORY

Growth is compounding:
revenue +42% while churn fell 2.1 pts — the engine is healthy, not bought.

Verdict: numbers code-rendered (never garbled), churn arrow points down, nothing invented — one governed pass instead of a 4-tool relay.

Guardrails are the product.
